**Mayor Michael Bloomberg calls for protection of
Delaware River Basin water resources**

New York City, New York – Mayor Michael Bloomberg requested on November 17, 2010 that the Delaware River Basin Commission conduct a cumulative impact study on the potential impacts of gas drilling on the Delaware River Watershed before the Commission develops natural gas regulations. The mayor points out that the “stakes are high” and billions have been invested in clean water in the Delaware River watershed, providing 15 million people throughout the Watershed with clean drinking water.

The Mayor states, “Because full-scale development of natural gas exploitation in the watershed could degrade water quality, a rush to regulate and drill risks the long-term viability of one of the most important drinking water sources in the United States”. He goes on to say he looks forward to discussing the issue with the Commission before they make any final decisions.

“Mayor Bloomberg’s letter is especially significant because New York State has a vote on the Commission and can directly influence the critical timing of the cumulative impact statement that the federal government will be funding on the potential adverse impacts of gas drilling in the Delaware River Watershed. The study must be done first and that information

used to inform the Commission's regulations if the are to prevent pollution and avoid degradation of River and its Watershed", said Maya van Rossum, the Delaware Riverkeeper.

"The foolhardy attempts of Pennsylvania and New Jersey to fast track the Commission's gas rules needs to be stopped so that the science can be completed and that information used to prepare the regulations", continued van Rossum. "Otherwise, regulatory attempts to protect our drinking water will be useless", she concluded.

The text of the letter follows:

The City of New York
Office of the Mayor
New York, N.Y.

November 17, 2010

Ms. Carol Collier
Executive Director
Delaware River Basin Commission
Post Office Box 7360
West Trenton, NJ 08628

Re: Delaware River Basin Commission's Draft Natural Gas Extraction Regulations

Dear Ms. Collier:

From the beginning of the discussion about drilling in the Marcellus Shale, we have said any decisions must be based on detailed scientific reviews that specifically take into account the unique nature of New York City's unfiltered water supply and that assess any potential harm. The City hired an independent expert to study the issue, and the findings showed that this kind of activity-based on current technology-should not be allowed in our watershed due to potential contamination, heavy industrialization, and the risks posed to our critical water infrastructure.

Based on our study of the issue-which is buttressed by a growing body of evidence from other states suggesting that hydraulic fracturing ("hydrofracking") can pollute local water sources-we are further convinced that the potential impacts of natural gas drilling on drinking water supplies must be carefully studied before proceeding with regulations that could dictate the extraction of this resource for many years. We strongly recommend that the Commission conduct a study of the potential cumulative impacts of natural gas drilling on water quantity and quality in the Delaware Basin before proceeding any further with the Draft Natural Gas Extraction Regulations.

The stakes are high. The City has invested more than \$1.5 billion in watershed protection programs that have resulted in improved water quality throughout our watershed, as well as to our releases downstream, which benefit all members of the Commission, and the 15 million people who rely on the Delaware River watershed for clean drinking water. The

Marcellus Shale is an important domestic source of clean energy, but it must be developed in a way that does not jeopardize critical natural resources like clean drinking water. Because full-scale development of natural gas exploitation in the watershed could degrade water quality, a rush to regulate and drill risks the long-term viability of one of the most important drinking water sources in the United States. Without the benefit of the critical information that a targeted study would provide, the proposed regulations may be insufficient to protect the vital natural resource that we share.

We look forward to discussing these significant concerns before the Commission makes any final decisions. Please do not hesitate to contact Cas Holloway, New York City's Department of Environmental Protection Commissioner, at (718) 595-6565 to discuss this matter further.

Sincerely,

Michael R. Bloomberg
Mayor
