

# STREAMKEEPERS FROM SCRATCH

## Building a Volunteer Monitoring Program

Watershed Congress

March 14<sup>th</sup>, 2015

**Stephanie Figary**, Water Quality Program Manager, Wissahickon Valley Watershed Association  
**Jon Musselman**, Municipal Upstream Coordinator, TTF Watershed  
**Alex Cooper**, Community Watershed Specialist, TTF Watershed

# Delaware River Watershed Initiative

# The Delaware River Watershed

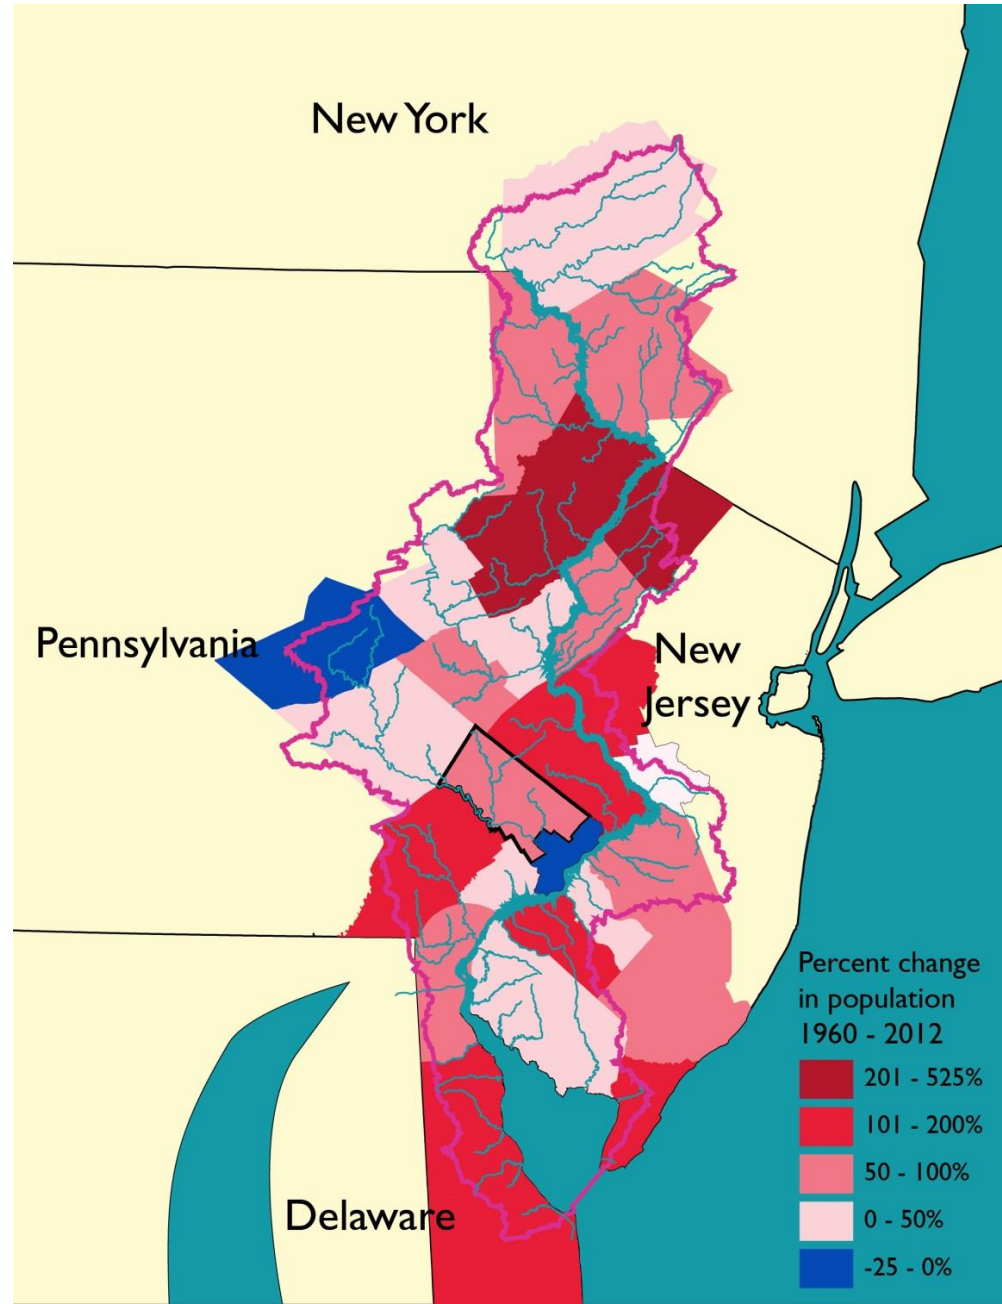

Four states

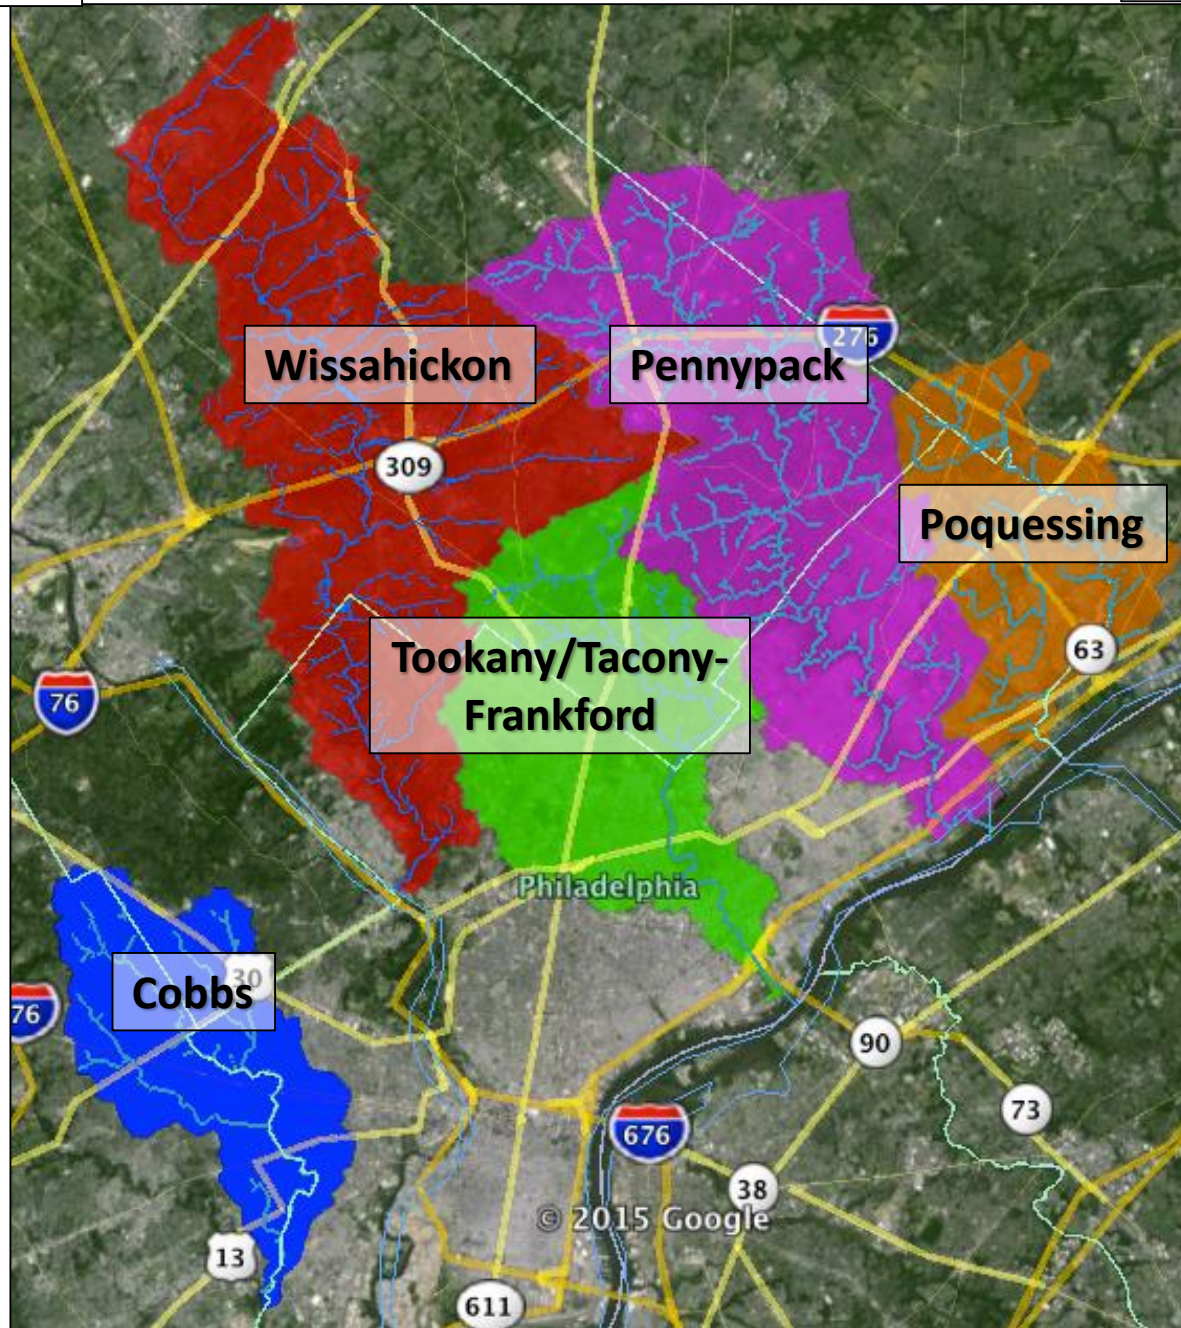

23,700 streams miles

42 counties

838 municipalities

Varying growth rates &  
Development pressure

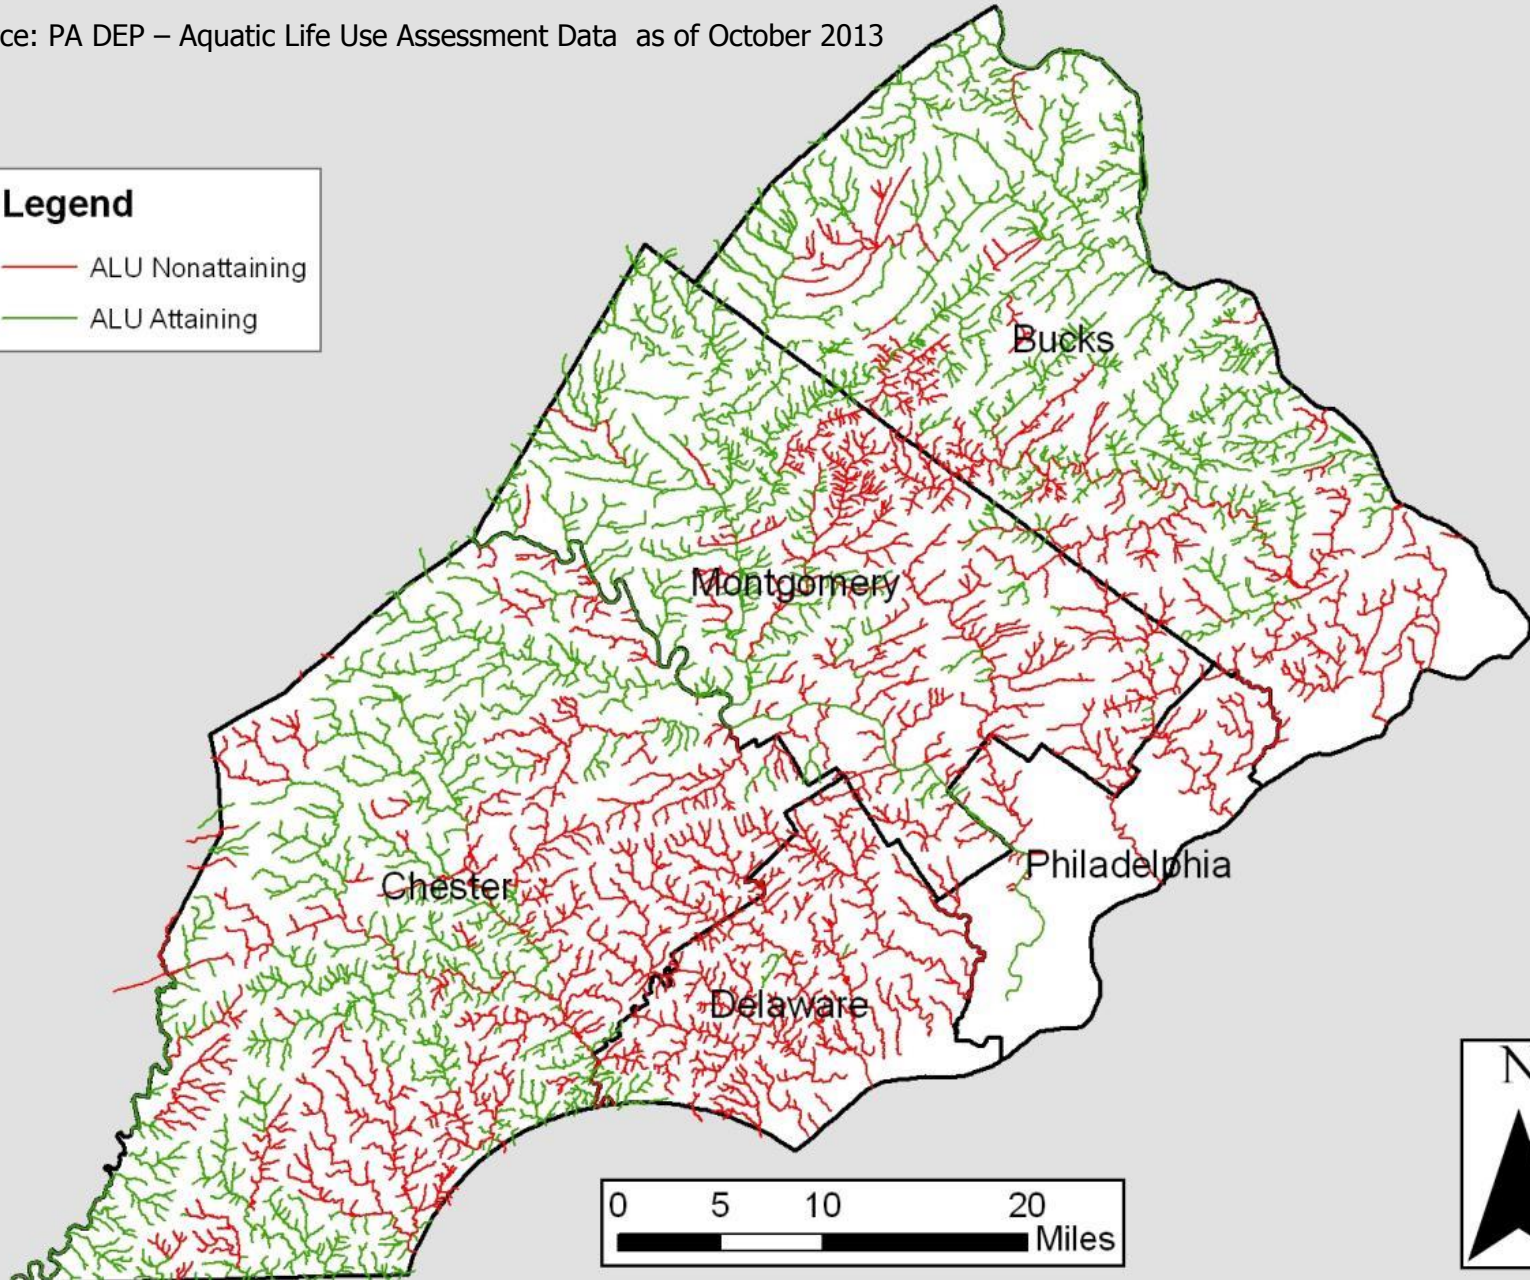

Source: PA DEP – Aquatic Life Use Assessment Data as of October 2013

### Legend

- ALU Nonattaining
- ALU Attaining

# Restoration Targets and Goals

Improve the management of stormwater runoff

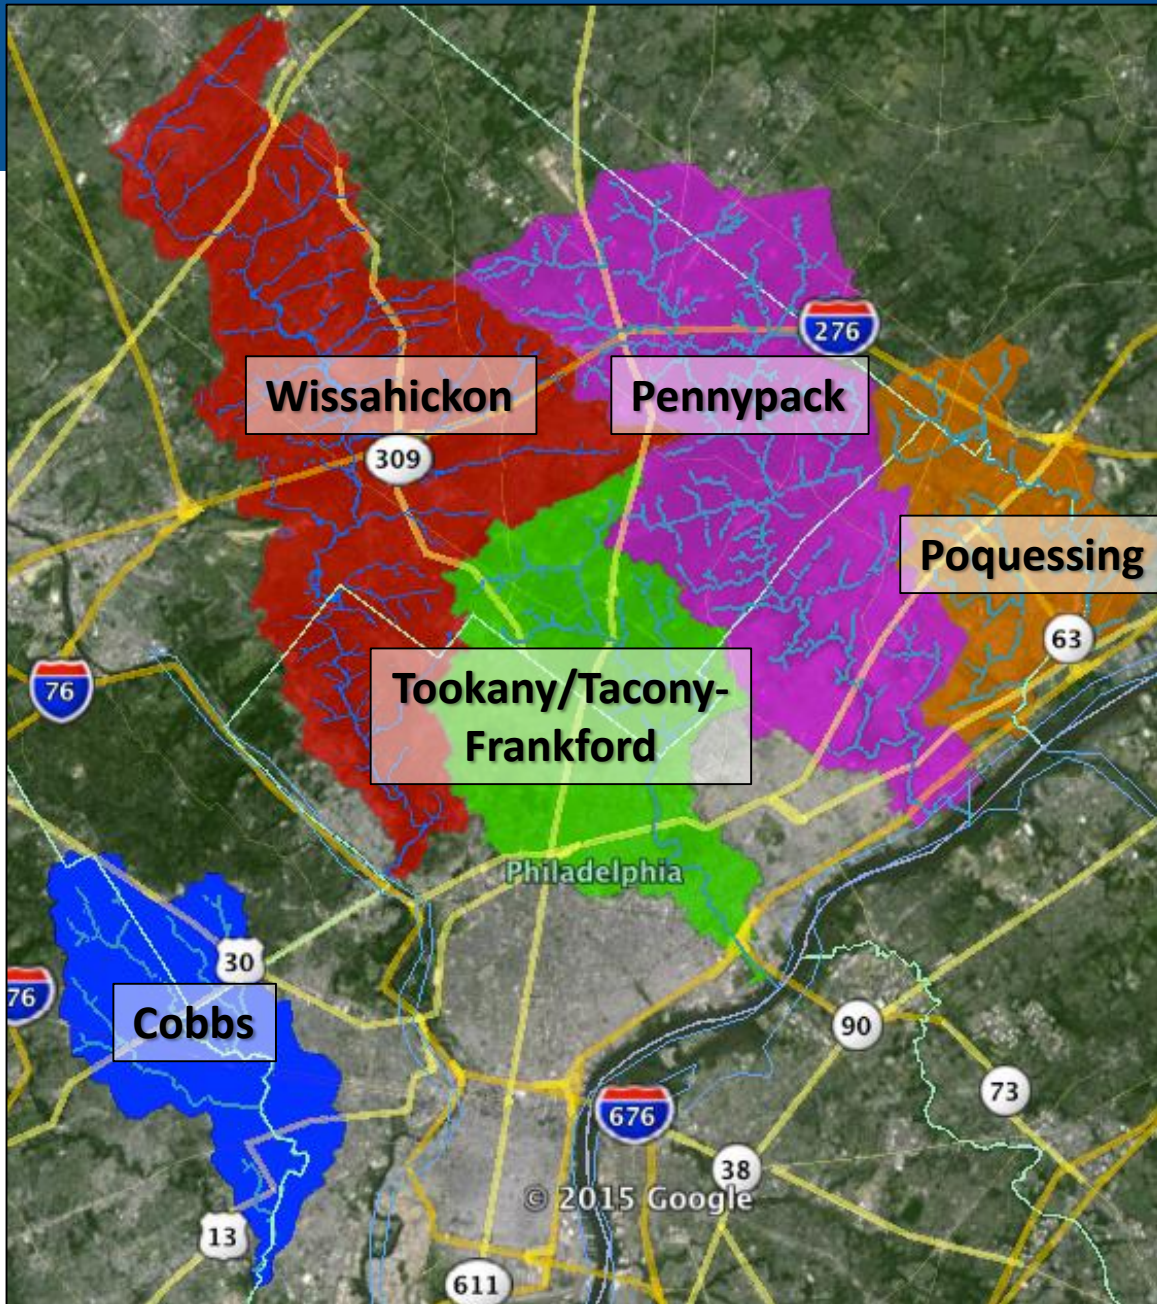

Improve the quality of riparian buffers

Improve the natural hydrologic conditions of streams and connectivity to associated floodplains and wetlands

Increase investment in WWTP and sewer systems

# Upstream Suburban Philadelphia Cluster

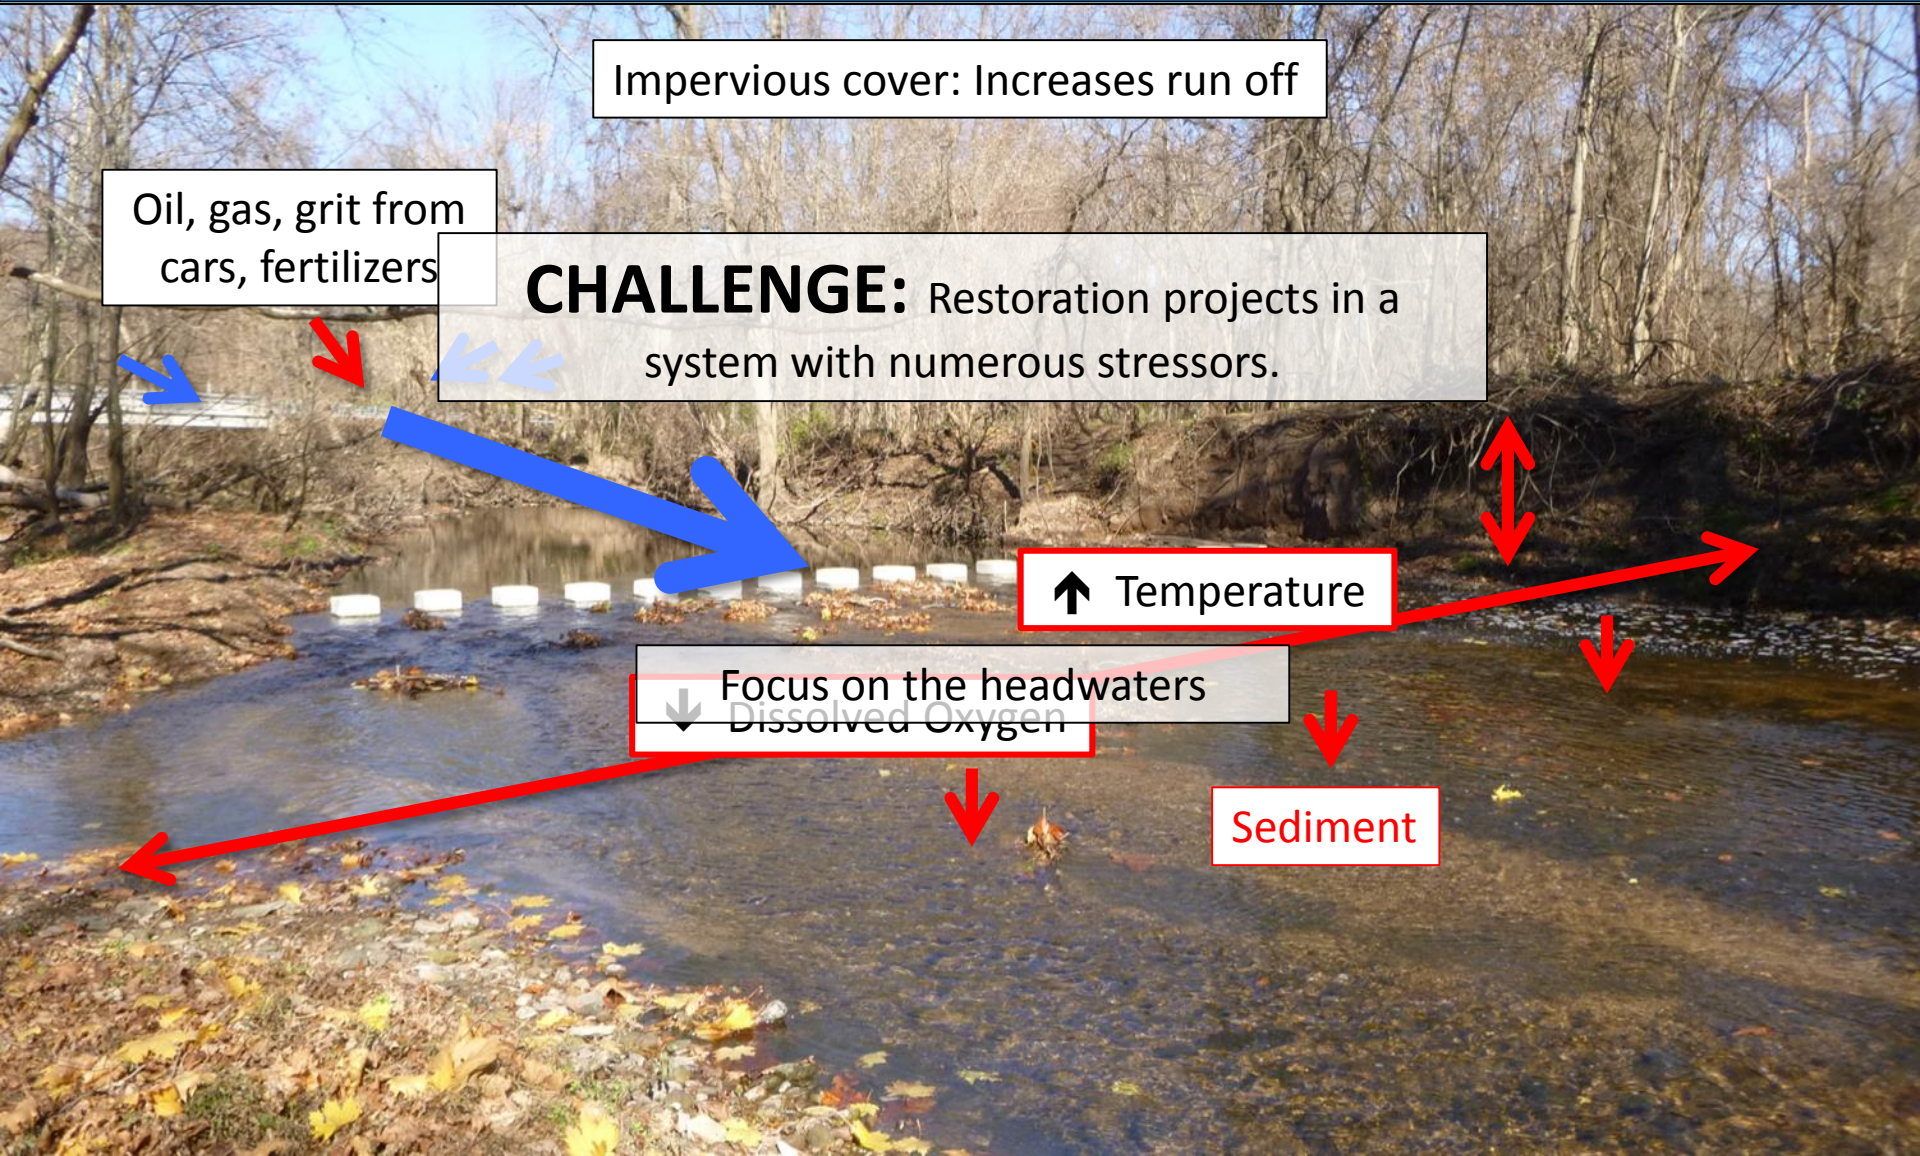

## Challenges:

- Impervious cover, aging infrastructure

## Tools:

- Restoration and green infrastructure
- Education and outreach
- Municipal collaboration

# Urban/Suburban Impacts

Impervious cover: Increases run off

Oil, gas, grit from cars, fertilizers

**CHALLENGE:** Restoration projects in a system with numerous stressors.

↑ Temperature

↓ Focus on the headwaters  
Dissolved Oxygen

Sediment

# Three Tiered Monitoring Approach

## University

Temple and Villanova  
Universities

## Watershed

Watershed Associations

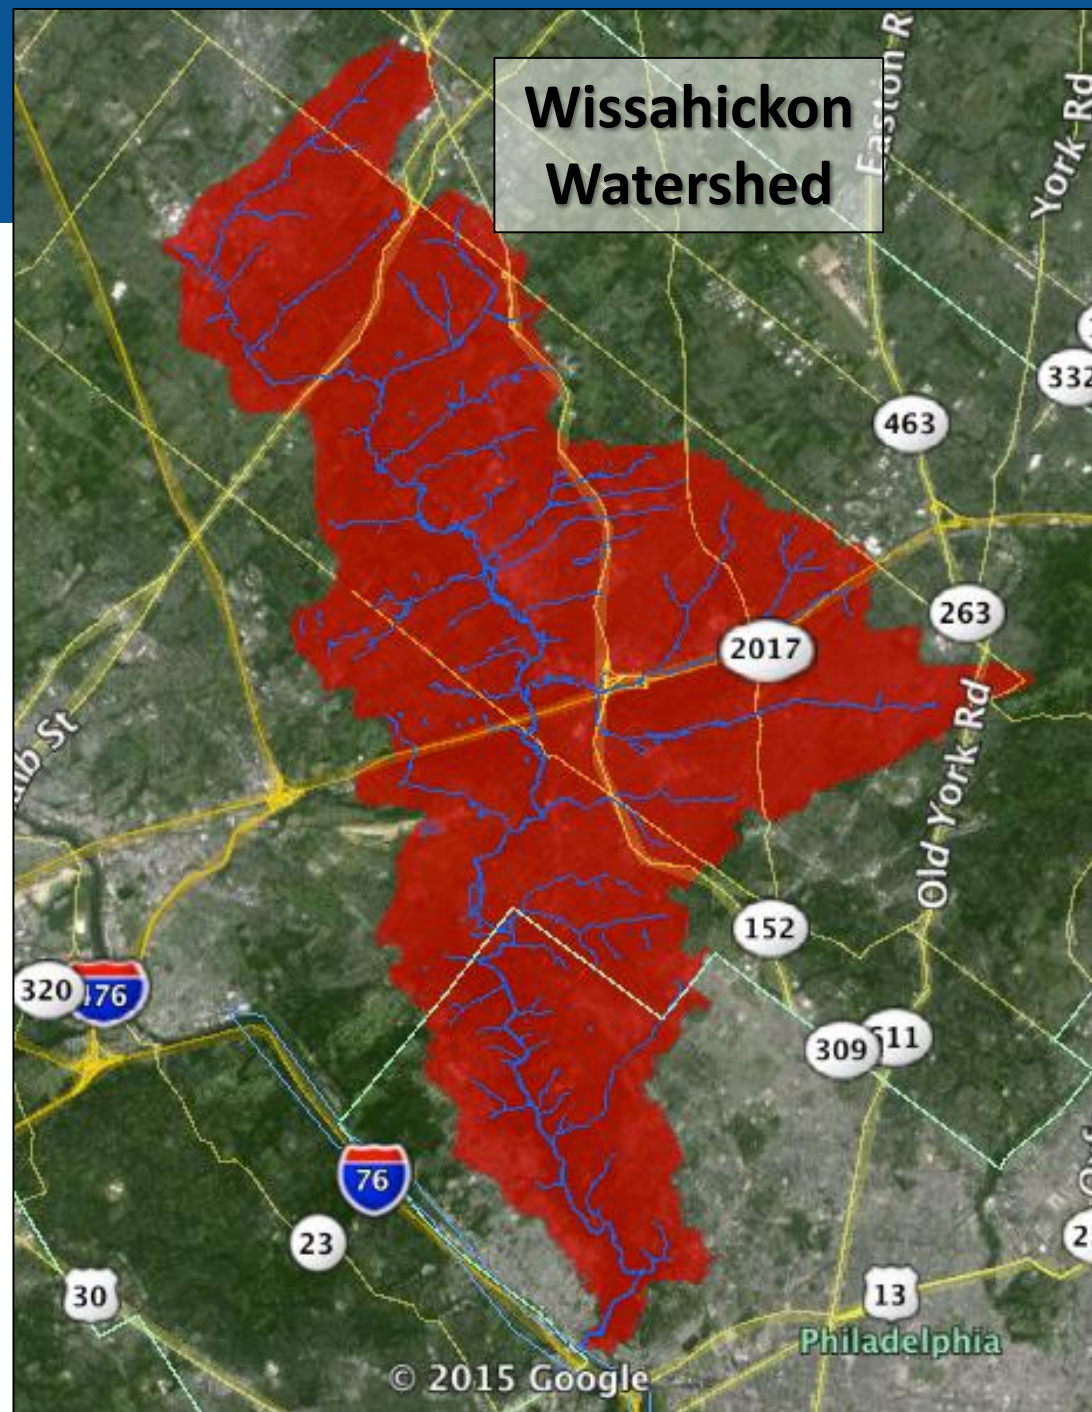

## Citizen

Citizen Scientists

- Collaborative
- Focused on project sites for improvements and effectiveness
- Watershed-wide
  - Understand the state of the watershed
  - Education and outreach

# Set up

- Limitations (time, infrastructure, budget)
- Guidance
  - Academy of Natural Sciences
  - Past monitoring programs
  - NJDEP
  - Regulations

# University Tier

## Goals:

- Statistically quantify water quality improvements
- Collect baseline data
- Determine the distance that water quality improvements are detected

# University Tier: Programs

- Sites (projects)
- Paired continuous loggers
  - Turbidity
  - Temperature
  - Water depth
  - Conductivity
  - Nitrate

# Watershed Tier

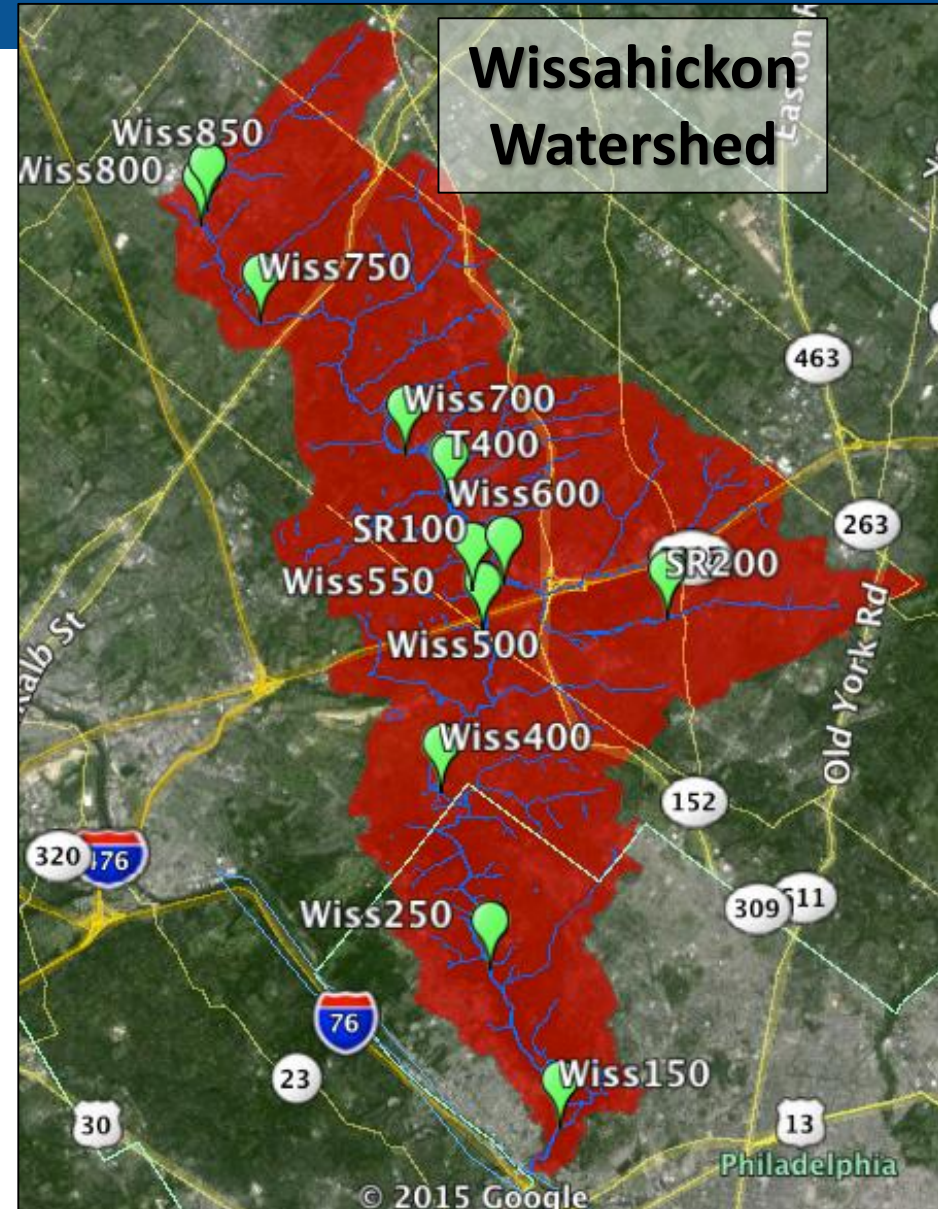

## Goals:

- Valuable data for communication and research
- Determine the current conditions in headwaters
- Monitor for changes

# Watershed Tier: Programs

- Sites (projects, main stem)
- Four times a year
  - Water chemistry (phosphorus, nitrogen, sediments, chlorides)
  - Stream side chemistry (Temp, dissolved oxygen, conductivity, pH)
  - Physical parameters (depth, width, flow, current conditions)
- Once a year
  - Macroinvertebrates
  - Habitat assessments

# Citizen Tier

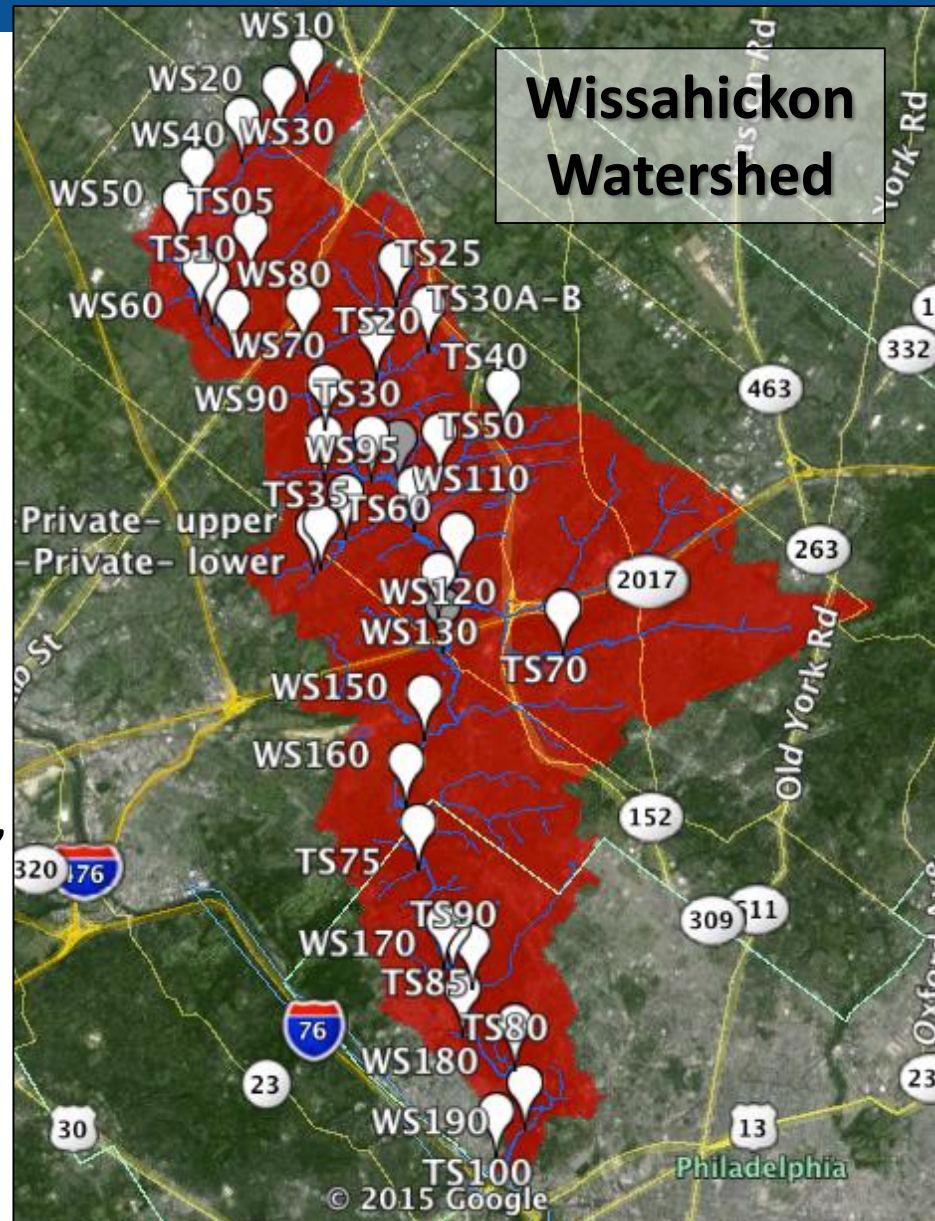

## Goals:

- Approachable training
- Longevity
- Early detection of environmental concerns
- Community engagement, education and outreach

# Citizens Tier: Program

- Started August 2014
  - ~100 citizen scientists over 5 watersheds
- Sites (public property, private homeowners)
- Once a month
  - Visual assessments (current conditions, absence/presence, changes in conditions)
  - Stream side chemistry (LaMotte kits, N and P)
- Additional training

# So far...

- Baseline year for watersheds, valuable in communication
- Adjustments made to sites
- Citizens are a powerful, enthusiastic group that can identify concerns
- Community value: requests for monitors
- Future training: monitoring project sites

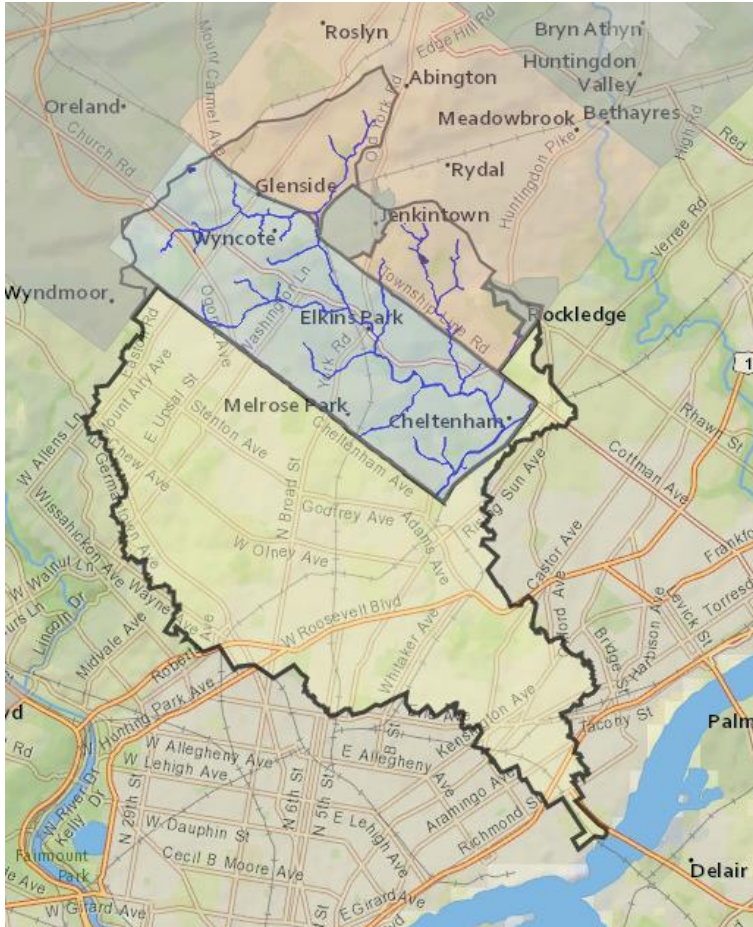

# STREAMKEEPERS FROM SCRATCH

## Building a Volunteer Monitoring Program

# TTF Watershed: Projects, Education and Outreach

# Citizen Science

Growing in popularity

Improved Technology

Community Involvement in local environmental issues

Education Opportunity – Science Literacy

Regulators establishing more programs

TTF Citizens Monitor the Jenkintown Creek

# Why Citizen Science for Stream Monitoring?

Planning, Identifying our goals and purpose for monitoring

- What are we monitoring?
- Purpose of Data
- Training & skills
- Equipment
- Location
- Coordination
- Submitting & Analyzing data

# Call for Volunteers

- Generate Interest
- Survey Volunteers
- Scheduling
- Commitment

## Training and Site Selection

YOUR FUTURE.**

## Report: Fall 2014

*Tookany/Tacony-Frankford Watershed*

## Compare Water Quality!

**1T** Tookany Creek   **3R** Rock Creek   **2B** Baeder Creek   **5J** Jenkintown Creek

### Shade

A forested riparian area provides shade for the creek and the life it supports. Shade is an indicator of a healthy creek.

### Leaf Packs

Leaves are a vital source of food in a stream. A healthy stream should have leaves in the creek all year.

### Algae Cover

Algae is important to a healthy stream ecosystem, often used as an indicator of water quality. Streamkeepers track the amount growing at their sites.

### Surface Coating

Bubbles, scum, and foam sometimes occur naturally, but detergents, oil, and other pollution can also be the source.

# 1T Tookany Creek

TTF 800—Ralph Morgan Park

TTF 1050—Jenkintown Road Bridge

TTF 350—Arcadia University

TTF 390—Grove Park

All **StreamKeepers** reported clear water clarity, normal odor, a brown stream bed, no aquatic vegetation, and an average PH of 7.29.
